

The Amazing Journey of Human Evolution

An exciting science adventure for curious minds (Ages 8–14)

Let's explore how humans changed over millions of years!

Welcome, Young Explorers!

Hello scientists! ■ Let's explore how humans evolved from early primates to modern humans. Are you ready to think, imagine, and discover? Let's begin!

Chapter 1: What Is Evolution?

Evolution means change over a very long time. Living things slowly change to survive better.

■ **Think About It:** Why do you think animals that survive better have more babies?

Chapter 2: Our Primate Family Tree

Humans are part of the primate family. We did not evolve from monkeys—we share a common ancestor!

Chapter 3: Timeline of Human Evolution

Time	Ancestor	What Changed?
7 million years ago	Early Hominids	First human-like primates
3–4 million years ago	Australopithecus	Walked upright
2–3 million years ago	Homo habilis	Made tools
1–2 million years ago	Homo erectus	Used fire
200,000 years ago	Homo sapiens	Modern humans

Chapter 4: Walking Upright

Walking on two legs freed our hands to carry food and tools.

Chapter 5: Growing Brains

Over time, human brains grew bigger, helping us think and solve problems.

Chapter 6: Making Tools

Stone tools helped early humans hunt, cut food, and survive.

Chapter 7: Meet Our Ancestors

- Australopithecus – small brain, walked upright
- Homo habilis – first tool maker
- Homo erectus – used fire
- Neanderthals – strong and smart
- Homo sapiens – modern humans

Chapter 8: Fun Facts

- Fire helped humans cook food.
- Early humans made cave art.
- Humans began in Africa!

Chapter 9: Activities

- Draw your favorite human ancestor.
- Quiz: Why was fire important?

Chapter 10: Glossary

Evolution: Change over time

Ancestor: A family member from long ago

Bipedal: Walking on two legs

You Did It!

Great job exploring human evolution. Keep being curious and asking questions! ■
